## Overview ${ }^{1}$

The M1T program can multiply $1^{\text {st }}$ order polynomial terms，e．g．：
$(\mathbf{x}+2)(\mathbf{x}+3)$ which is $\mathbf{x}^{2}+5 \mathbf{x}+6$ ．
（The mathematical calculations center，Quick Math，of Ben Langton can help to solve expressions．）

## Examples

Please note that my default FIX 5 setting which can be replaced by your preferred number of decimals at line 53 or for program execution at line 46.

## Program Listing

The listing of M1T is given below. The registers ROO-Rxx are only used to store the calculated coefficients. The calculation itself is carried out only by using the stack registers in the loop around LBLO 4.
